L7: Entry 1 of 2 File: USPT May 6, 2003

DOCUMENT-IDENTIFIER: US 6558903 B1 TITLE: Kinases and uses thereof

Drawing Description Text (11):

FIG. 10 shows the amino acid sequence alignment for the protein (h15990; SEQ ID NO:8) encoded by human 15990 (SEQ ID NO:7) with the Arabidopsis thaliana putative protein kinase (A. thal. BAC clone; GenBank Accession Number AAD30583; SEQ ID NO:26), the Arabidopsis thaliana serine/threonine kinase-like protein (A. thal. Ser/Thr kin-like pro; EMB Accession Number CAB43919; SEQ ID NO:27), the human serine/threonine kinase RICK (hBAC clone; GenBank Accession Number AAC24561; SEQ ID NO:28), the human serine/threonine kinase receptor interacting protein (hSer/Thr Kin. RIP; SP Accession Number Q13546; SEQ ID NO:29), the murine serine/threonine kinase receptor interacting protein (mSer/Thr Pro. Kin. RIP; SP Accession Number Q60855; SEQ ID NO:30), and the Rattus norvegicus homocysteine respondent protein (GenBank Accession Number AAD02059; SEQ ID NO:31). The sequence alignment was generated using the Clustal method.

Detailed Description Text (104):

Suitable eukaryotic host cells include insect cells (examples of Baculovirus vectors available for expression of proteins in cultured insect cells (e.g., Sf 9 cells) include the pAc series (Smith et al (1983) Mol. Cell Biol. 3:2156-2165) and the pVL series (Lucklow and Summers (1989) Virology 170:31-39)); yeast cells (examples of vectors for expression in yeast S. cerevisiae include pYepSec1 (Baldari et al. (1987) EMBO J. 6:229-234), pMFa (Kurjan and Herskowitz (1982) Cell 30:933-943), pJRY88 (Schultz et al. (1987) Gene 54:113-123), pYES2 (Invitrogen Corporation, San Diego, Calif.), and pPicZ (Invitrogen Corporation, San Diego, Calif.)); or mammalian cells (mammalian expression vectors include pCDM8 (Seed (1987) Nature 329:840) and pMT2PC (Kaufman et al. (1987) EMBO J. 6:187:195)). Suitable mammalian cells include Chinese hamster ovary cells (CHO) or COS cells. In mammalian cells, the expression vector's control functions are often provided by viral regulatory elements. For example, commonly used promoters are derived from polyoma, Adenovirus 2, cytomegalovirus, and Simian Virus 40. For other suitable expression systems for both prokaryotic and eukaryotic cells, see chapters 16 and 17 of Sambrook et al. (1989) Molecular Cloning: A Laboratory Manual (2d ed., Cold Spring Harbor Laboratory Press, Plainview, N.Y.). See, Goeddel (1990) in Gene Expression Technology: Methods in Enzymology 185 (Academic Press, San Diego, Calif.). Alternatively, the recombinant expression vector can be transcribed and translated in vitro, for example using T7 promoter regulatory sequences and T7 polymerase.
